TISSUE SPECIFICITY: Strongly expressed in brain and inner the inner ear, it is mainly expressed in the cochlear IHC vestibular type I sensory hair cells. Weakly expressed in heart, skeletal muscle, liver, kidney, lung and testis. SIMILARITY: BELONGS TO THE FEBLIN FAMILY.

SIMILARITY: CONTAINS 4 C2 DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vesicle-plasma membrane fusion.
SUBCELLULAR LOCATION: Type II membrane protein (By similarity)
ALTERNATIVE PRODUCTS: At least 2 isoforms; 1 (shown here) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               musculus (Mouse).

FUNCTION: THE ABC EXCUSION NUCLEASE IS A DNA REPAIR ENZYME THAT CATALYZES THE EXCISION REACTION OF UV-DAMAGED NUCLEOTIDE SEGMENTS PRODUCING OLIGOMERS HAVING THE MODIFIED BASE(S). UVRA IS AN ATPASE AND A DNA-BINDING PROTEIN THAT PREFERENTIALLY BINDS SINGLE-STRANDED OR UV-IRRADIATED DOUBLE-STRANDED DNA (BY SIMILARITY).

SUBCELLULAR LOCATION: CYtoplasmic (By similarity).

- SIMILARITY: BELONGS TO THE ABC TRANSPORTER FAMILY. UVRA SUBFAMILY.
                                                                         response;
                                                                                                                                                                                                                                                                                                                                      SWISS-PROT entry is copyright. FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells. SUBUNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement
 TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBHANKS.

FTM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS

AND O-LINKED OLIGOSACCHARIDES.

SUBCELLULAR LOCATION: Membrane-associated.
TISSUE SPECIFICITY: Highly expressed in skeletal muscle, testis, adrenal gland and thymus, followed by pancreas, liver, heart and thymus. Weakly expressed in kidney, placenta, brain and lung. MISCELLANGOUS: Optimum pH is 3.8.
SIMILARITY: BELONGS TO FAMILY 33 OF GLYCOSYL HYDROLASES.
SIMILARITY: CONTAINS 3 BNR REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          glycoconjugates
CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)
alpha-(2->8)-glycosidic linkages of terminal soligosaccharides, glycoproteins, glycolipids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Plays a role in modulating the the lipid bilayer at the level of membran
